

Project: Prism IQ

Version: 1.0

Status: Design Freeze

Design Language: Modern AI SaaS Workspace

Design Philosophy: Elegant • Minimal • Intelligent

1. Design Vision

Prism IQ should not look like a college project or a generic admin dashboard.

It should feel like a modern SaaS product where users spend time analyzing data comfortably.

Inspired by the experience of products such as Linear, Notion, Vercel, Perplexity, Supabase and modern AI workspaces, Prism IQ focuses on clarity, hierarchy, and reducing cognitive load.

2. UX Principles

Every screen should follow these principles:

- One primary action per screen.
 - Important information always appears first.
 - Complex analytics should be presented in digestible cards.
 - Visual hierarchy should guide the user's attention naturally.
 - Minimize unnecessary clicks.
 - Every pipeline stage should clearly indicate progress.
 - Never overwhelm users with raw statistics without context.
-

3. Product Personality

If Prism IQ were a person, it would be:

- Intelligent
- Professional
- Calm
- Confident

- Helpful
- Modern

Avoid flashy, playful, or gaming-style visuals.

4. Visual Theme

Primary Theme

Dark Mode (MVP)

Future versions may introduce Light Mode, but all initial components will be optimized for dark mode.

Sophie Moore (Teacher)

Welcome to Business 101. I'm really glad to see so many of you here—some nervous, some excited, and a few probably just wondering what this class will be like. Let me start by saying this and I can show learning how.

Welcome to Business 101. I hope

- 500
- 600

Monospace

JetBrains Mono

Used for:

- Dataset IDs
- API Keys
- Technical Information

7. Spacing System

Follow an **8-point grid** throughout the application.

Spacing scale:

4
8
16
24
32

48

64

Consistent spacing improves readability and responsiveness.

8. Border Radius

Small Components

8px

Cards

16px

Dialogs

20px

Buttons

12px

9. Elevation & Shadows

Cards should appear slightly elevated using soft shadows and subtle borders.

Avoid heavy shadows.

Preferred approach:

- Low opacity borders
 - Mild blur
 - Layered surfaces
-

10. Iconography

Library:

Lucide React

Guidelines:

- Outline icons only.
- Consistent stroke width.
- Pair every pipeline stage with a recognizable icon.

11. Navigation Structure

Instead of a traditional admin sidebar, Prism IQ uses a **Pipeline Sidebar**.

Each item represents a stage in the analytics lifecycle.

The current stage should be visually highlighted.

12. Layout System

Application Layout

The workspace remains the primary focus.

13. Dashboard Philosophy

The dashboard is a **workspace**, not a collection of unrelated widgets.

It should answer three questions immediately:

1. What dataset am I working on?
 2. What is its current health?
 3. What should I do next?
-

14. Dashboard Layout

Recommended Bento Grid:

The main visualization always occupies the largest area.

15. Import Experience

The import screen is the user's first interaction.

It should include:

- Drag & Drop Upload
- Browse File Button
- Import from URL
- Import from API
- Supported Formats
- Maximum File Size
- Recently Imported Datasets (Future)

After upload:

- Progress Indicator

- Success Confirmation
 - Automatic transition to Profiling
-

16. Data Profiling UI

Display information using KPI cards:

- Rows
- Columns
- Missing Values
- Duplicate Rows
- Memory Usage
- Quality Score

A detailed table should list each column with:

- Data Type
 - Missing Count
 - Unique Values
 - Sample Values
-

17. Smart Cleaning UI

Present cleaning suggestions as reviewable actions.

Each suggestion includes:

- Issue detected
- Recommended fix
- Expected impact
- Apply toggle

Provide:

- Preview before cleaning
 - Summary after cleaning
 - Download Cleaned Dataset button
-

18. EDA Workspace

Split layout:

Charts should support:

- Zoom
- Hover tooltips
- Export as PNG

19. Predictive Analytics UI

Workflow:

Model comparison should use sortable tables with clear metrics and badges.

20. Recommendation Cards

Each recommendation contains:

- Priority badge
- Title
- Explanation
- Confidence score
- Suggested action

Avoid long paragraphs.

Keep recommendations concise and actionable.

21. Reports

Before downloading, show a report preview.

Sections:

- Executive Summary
- Dataset Overview
- Cleaning Summary
- Key Charts
- Model Performance
- Recommendations

Export options:

- PDF
 - Cleaned CSV
-

22. Buttons

Primary

Gradient Prism Blue → Violet

Secondary

Outlined

Danger

Red

Ghost

Transparent

Icon Buttons

Rounded square

23. Forms

Every form should include:

- Labels
- Helper text
- Validation feedback
- Loading state
- Disabled state

Validation errors appear below the field.

24. Tables

Requirements:

- Sticky header
- Search
- Sorting
- Pagination
- Horizontal scrolling for wide datasets

Highlight missing values or anomalies where appropriate.

25. Notifications

Toast notifications:

- Upload Success
- Cleaning Completed
- Model Training Finished
- Report Generated
- Error Messages

Duration:

3–5 seconds

26. Loading States

Use skeleton loaders instead of spinners wherever possible.

Long-running tasks (profiling, model training) should display progress with informative status messages.

27. Empty States

Every empty page should explain:

- Why it's empty.
- What the user should do next.

Example:

"No dataset imported yet. Upload a CSV, Excel file, connect to an API, or import an HTML table to begin."

28. Responsive Design

Breakpoints:

- Desktop (Primary)
- Laptop
- Tablet
- Mobile (Read-only MVP)

The analytics workspace is optimized for desktop, while mobile focuses on viewing rather than editing.

29. Accessibility

- WCAG-conscious color contrast.
 - Keyboard navigation for forms.
 - Visible focus states.
 - Icons paired with text labels.
 - Avoid color-only indicators.
-

30. Motion Design

Animations should reinforce actions, not distract.

Use subtle transitions for:

- Page changes
- Card appearance

- Chart loading
- Success feedback

Keep durations around 150–300 ms.

31. Component Library (Initial)

Core reusable components:

- App Shell
 - Sidebar
 - Header
 - Breadcrumb
 - KPI Card
 - Metric Card
 - Upload Dropzone
 - Data Table
 - Quality Badge
 - Status Badge
 - Chart Container
 - Insight Card
 - Recommendation Card
 - Model Comparison Table
 - Report Preview
 - Empty State
 - Error State
 - Skeleton Loader
 - Toast Notification
 - Confirmation Dialog
-

32. Design Tokens

Define reusable tokens for:

- Colors
- Typography
- Spacing
- Border Radius

- Shadows
- Transitions
- Z-index
- Breakpoints

These tokens become the single source of truth for the frontend.

33. Screen Inventory

MVP screens:

1. Landing
 2. Import
 3. Dataset Profile
 4. Cleaning
 5. Explore (EDA)
 6. Predict
 7. Insights
 8. Reports
 9. Settings (Placeholder)
-

34. Final UX Principles

Every screen should answer:

- **Where am I?**
- **What just happened?**
- **What should I do next?**

Every interaction should leave the user feeling that the platform is guiding them through the analytics pipeline.

Phase 6 Deliverables

The design system now defines:

- Visual identity
- Color palette
- Typography
- Layout rules
- Navigation

- Dashboard philosophy
- Pipeline-based UX
- Reusable components
- Responsive behavior
- Accessibility guidelines
- Motion principles
- Screen inventory

This document becomes the foundation for all frontend implementation.
